The Air Cleaner

By Kavel

This is a structure to make the air clean. The materials I used were paper, scissors, thread, tape and a marker. I had to use my fine-motor skills because I had to do a lot of eye hand coordinating when I was using the straws. Through this task I learned how to make a hand that can move because it was the hard part in my structure.

This is my plan of how to make my structure. The purpose of the air cleaner is to make the air clean. this is how the air cleaner works the people come and put the seeds

and then the hands do the rest of the work. Then a very strong bubble sucks the good air from the trees and then pushes it into the city.

These are two hands and I drew them both so I could choose which one is better. I even put the materials I needed. And I even wrote how to make the hand.

The hand is the hard part because it is hard to do eye-hand coordination. And that hand sticker means that, that is the hard part in my structure.

Step 7 -Relation

I felt happy because it was fun to fix the straws. One problem I had was that when I was putting the straws they were coming off. I solved this problem by putting tape on the straws.

step 6- creating

This is me making my hand that can move and I am watching a video so I know how to make a hand that can move.

I think eye-hand coordination is important because if you do not know how to do eye-hand coordination you can't use your hand and your eye together.
